*Governments and donors spend billions of dollars subsidizing entrepreneurship training programs around the world. Some common rationales for these programs include that they can improve access to training services and promote employment among groups affected by discrimination, but it has been difficult to test rigorously whether such benefits exist. Using a randomized evaluation, researchers found little evidence supporting these common rationales for subsidizing entrepreneurship training in the United States.*

**Desafío de política pública:** Governments and donors spend billions of dollars subsidizing entrepreneurship training programs around the world. Arguments for subsidizing training for entrepreneurs are manifold. For one, if potential recipients are unable to pay for valuable training

services, offering training at a reduced-cost to recipients may be a cost-effective way (compared to, say, subsidizing lending) to improve access. Additionally, if minorities face greater discrimination from employers, then subsidizing training may be a relatively efficient method for promoting employment among groups affected by discrimination in the labor market. But such arguments have been difficult to evaluate empirically because individuals who decide to enroll in training may have particular qualities, such as being more motivated, that set them apart from others who do not seek training opportunities.

**Contexto de la evaluación:** Growing America through Entrepreneurship (Project GATE) was an evaluation designed and implemented by the U.S. Department of Labor and U.S. Small Business Association. The GATE experiment is the largest-ever randomized evaluation of entrepreneurship

training and assistance, involving more than four thousand participants. It differs from earlier large-scale evaluations in the United States because its training was marketed to any individual interested in starting or growing a business, and not limited to individuals receiving unemployment or welfare benefits.

**Detalles de la intervención:** Using Project GATE, researchers tested whether self-employment training effectively reduces difficulties that individuals face in identifying and securing employment by providing them with skills to start or expand small businesses. GATE was administered between September 2003 and July 2005 in seven cities of varying sizes. Fourteen different organizations provided the GATE training, including Small Business Association-funded and non-profit community-based organizations, all of which had been in operation prior to the experiment.

More than four thousand individuals applied for a limited number of slots for free entrepreneurship training services. Applicants were informed “GATE does not have space for everyone” and that a “lottery or random drawing will decide whether you will be able to enter the program.” Applicants assigned to receive the program were then offered an array of best-practice training services, beginning with a one-on-one assessment meeting to determine an individual’s specific training needs. Subjects assigned to the comparison group were not offered any free services. Baseline data comes from a nine-page application form, and follow-up surveys were conducted 6, 18, and 60 months after treatment.

**Resultados y lecciones de política pública:** Individuals assigned to receive the GATE program were 37 percentage points (84 percent) more likely to receive any training in the 6 months following randomization compared individuals in the comparison group. The treatment group also received more than twice the number of hours of training by the first follow-up survey. More than 85 percent of recipients reported the training was “very useful” or “somewhat useful” in follow-up surveys. Individuals in the treatment group were also 13 percentage points (34 percent) more likely to create a business plan 6 months following randomization over a base of 37.3 percent in the comparison group.

*Effects on Business Ownership and Performance:*

Entrepreneurship training increased average levels of business ownership in the short-run, but the effect faded over time. At the 6-month follow up survey, individuals in the treatment group were 13.4 percentage points (37.2 percent) more likely to own a business compared to the comparison group. 18 months later, the effect was still positive but the difference was smaller (6.9 percentage points or 16.9 percent). Nevertheless, the results indicate that the effects faded over time. There were no effects on business sales or the likelihood of having an employee, even during the first 6 months.

Entrepreneurship training did not increase the likelihood of creating high-revenue or high-employment firms in the five years following randomization: businesses created by the treatment group were not more likely to be successful than businesses created by the comparison group.

*Effects on Overall Employment, Household Income, and Work Satisfaction:* At 6 months, there is a positive effect on employment, but similar to the business ownership effect, the effect on overall employment dissipates over time. For income and work satisfaction, no significant effects are found at any horizon.

*Testing the Rationale for Training Subsidies:*

- One justification for training subsidies is that credit constraints prevent potential entrepreneurs from accessing training that could help them start a business. The GATE study found that for those who report having bad or no credit, entrepreneurship training had no strong lasting effects.
- Another rationale suggested for subsidizing training is that education or managerial capital constraints may prevent individuals from opening a business or gaining employment. However, the GATE study found little evidence that training has lasting effects, or particularly strong effects, on those with less education, less family business experience, or less managerial experience.
- Labor market discrimination may be another reason to offer training subsidies, if access to entrepreneurship training promotes employment among groups affected by

discrimination. The GATE study found no evidence that training has lasting or particular strong effects for minorities or women.

- Lastly, unemployment insurance frictions present another rationale for training subsidies, but limited support for this hypothesis is found. The GATE treatment effect on business ownership at 6-months was significantly greater for those who were initially unemployed compared with those who were employed at baseline. But no other evidence of relatively strong or lasting effects for the unemployed is found.

This analysis suggests that many of the rationales put forward for subsidizing training—countering credit or human capital constraints in enterprise development, or labor market discrimination—are not seen in the data. The GATE's training increased the likelihood of business ownership for the unemployed in the short run, but effects did not last. These findings, and the estimated costs of providing training to GATE recipients (between US\$1,321 per person), suggest that entrepreneurship training may not be a cost-effective method of addressing credit, human capital, discrimination, or employment constraints.

The Abdul Latif Jameel Poverty Action Lab (J-PAL) is a network of 194 affiliated professors from 62 universities. Our mission is to reduce poverty by ensuring that policy is informed by scientific evidence. We engage with hundreds of partners around the world to conduct rigorous research, build capacity, share policy lessons, and scale up effective programs. J-PAL was launched at the Massachusetts Institute of Technology (MIT), and now has regional offices in Africa, Europe, Latin America & the Caribbean, North America, South Asia, and Southeast Asia. For more information visit [povertyactionlab.org](http://povertyactionlab.org).
