

Why Randomize? Lecture & Case Study

Ben Morse Senior Research, Education, and Training Manager J-PAL Global

June 9, 2020

Session Overview

- I. Background
- II. Why randomize case study
 - I. Non-experimental methods
 - II. Randomized evaluations
- III. Conclusions

I - BACKGROUND

What is the impact of this program?

What is the impact of this program?

How to measure impact?

Impact is defined as the difference between:

- the outcome some time after the program has been introduced (the "factual")
- 2. the outcome at that same point in time had the program not been introduced (the "counterfactual")

factual – *counterfactual* = *impact*

Impact: What is it?

Impact: What is it?

Time

Counterfactual

The **counterfactual** represents the world that program participants would have experienced in the absence of the program

Problem: Counterfactual cannot be observed

Solution: We need to "mimic" or construct the counterfactual

Constructing the counterfactual

- Usually done by selecting a group of individuals that **did not** participate in the program
- This group is usually referred to as the control group or comparison group
- How this group is selected is a key decision in the design of any impact evaluation

Selecting the comparison group

Idea: Comparability

Treatment

Comparison

• Goal: Attribution

J-PAL | WHY RANDOMIZE

3 Key Ideas about Impact

1 - Counterfactual

2 – Comparison group mimics the counterfactual

Treatment

Comparison

3 - Goal of Impact Evaluations: Attribution

J-PAL | WHY RANDOMIZE

Session Overview

 - II. Randomized evaluations

III. Conclusions

II – Why randomize case study

Workplace Wellness Programs

Problem: Medical spending has risen rapidly over the past several decades, especially in the U.S.

Proposed solution: Employer-sponsored workplace wellness programs

- Goal: reduce costs by improving employee health
- Activities include:
 - Health screenings
 - Fitness programs
 - Classes on leading healthy lifestyles

Source: Illinois Workplace Wellness Study

Relevance to other settings

- This is a U.S.-based example, but the takeaways translate to any setting where some people participate in a program, and some do not
- Examples include evaluations of:
 - Low-interest microfinance loans on business growth
 - Vouchers for fertilizer on crop yields
 - Subsidized meals for school children on learning
 - Subsidized chlorine dispenses on water quality and child health
 - Subsidized vaccination programs on child health
 - Subsidized bed-nets on malaria
- Challenge is the same: find a valid counterfactual for participants

In 2016, University of Illinois launched the *iThrive* Wellness Program

- Biometric screening and
 health risk assessment
- Wellness activities such as:
 - Exercise classes
 - WeightWatchers
 - Smoking cessation
 - Stress management

iThrive 💙 Health Screening & Assessment 🛛 💆 Wellness Activities 9 FAQ Contact Welcome John Doe 🕞 Logout H My Portal My Portal My Portal gives you information about your progress in iThrive, a program to promote health and wellness among campus faculty and staff. iThrive offers you the opportunity to participate in valuable health screening and wellness activities at no cost to you. In addition, you can receive financial rewards for completing certain elements of IThrive. To earn rewards and to participate in Wellness Activities, you must complete your Health Screening by Friday, September 16th and the Health Assessment by Friday, September 30. Your participation reward: \$200.00 of \$350.00 earned so far Step 1: Health Screening & Assessment Step 2: Wellness Activities The first step in IThrive is to complete your Health Screening and After you have completed Step 1, you may register to participate in a Health Assessment. After you complete your Health Screening, you will well ness activity. You may use the information provided to you in your be able to access your online Health Assessment. Learn more about Health Assessment to select a program that best addresses an area of Health Screening & Assessment » your health that you would like to improve. Learn more about Wellness Activities » Congratulations! You have completed your Health Screening and Health Assessment. Registration for Fall Activities is now closed. More information about Spring Activity registration will be made available soon. Reward for completing both the Health Screening and Health Assessment: \$200.00 Reward for completing Fall activity: \$75.00 Reward for completing Spring activity: \$75.00 Health Screening completed

✓ Health Assessment completed

Research team focused on three key questions:

- Do wellness programs help employees live healthier lifestyles?
- Are these changes sufficient to lower medical spending?
- Can they also improve employee productivity?

My Portal gives you information about your progress in iThrive, a program to promote health and wellness among campus faculty and staff. IThrive offers you the opportunity to participate in valuable health screening and wellness activities at no cost to you. In addition, you can receive financial rewards for completing certain elements of iThrive.

To earn rewards and to participate in Wellness Activities, you must complete your Health Screening by Friday, September 16th and the Health Assessment by Friday, September 30.

Your participation reward: \$200.00 of \$350.00 earned so far

Step 1: Health Screening & Assessment

The first step in IThrive is to complete your Health Screening and Health Assessment. After you complete your Health Screening, you will be able to access your online Health Assessment. Learn more about Health Screening & Assessment »

Congratulations! You have completed your Health Screening and Health Assessment.

Reward for completing both the Health Screening and Health Assessment: \$200.00

Health Screening completed

Health Assessment completed

🔁 Step 2: Wellness Activities

After you have completed Step 1, you may register to participate in a wellness activity. You may use the information provided to you in your Health Assessment to select a program that best addresses an area of your health that you would like to improve. Learn more about Wellness Activities >>

Registration for Fall Activities is now closed. More information about Spring Activity registration will be made available soon.

Reward for completing Fall activity: \$75.00

Reward for completing Spring activity: \$75.00

Outcomes and Data

- Employee fitness
 - Campus gym visits per month
- Medical spending
 - Insurance claims of in-patient, out-patient, and pharmaceutical spending
- Employee productivity
 - Index of: Promotion, job retention, sick leave taken, hours worked per week, and self-reported job satisfaction and productivity
- Background data
 - Age, gender, race, and socio-economic status

Simple difference

Compare employees who participated in the program to those that did not

J-PAL | WHY RANDOMIZE

Simple Difference

Counterfactual: Non-participants' frequency of gym visits, levels of spending, and productivity

Key assumption: Participants' would have had the same levels of these outcomes as non-participants if they had not received the program

Which of these scenarios would make the simple difference comparison misleading? (select all that apply)

- A: Healthcare costs tend to increase overtime
- B: Participants live closer to campus than non-participants
- C: Participants are younger than non-participants

Simple Difference

Counterfactual: Non-participants' frequency of gym visits, levels of spending, and productivity

Key assumption: Participants' would have had the same levels of these outcomes as non-participants if they had not received the program

What might threaten this assumption: Any systematic difference between participants and non-participants that influences our outcomes

Statisticians call this **selection bias**, because those who "select in" to a program are different from those who do not in terms of their pre-program outcomes

Pre-Post (Before vs. After)

Compare participants' outcomes before the program to their outcomes after the program

J-PAL | WHY RANDOMIZE

Pre-Post (Before vs. After)

Pre-Post (Before vs After)

Counterfactual: Participants' average levels of fitness, spending, and productivity before the program

Pre-Post (Before vs After)

Counterfactual: Participants' average levels of fitness, spending, and productivity before the program

Assumptions: Participants' fitness, spending, and productivity would not have changed over time in the absence of the program Which of these scenarios would make the prepost comparison misleading? (select all that apply)

- A: Healthcare costs tend to increase overtime
- B: Participants live closer to campus than non-participants
- C: Participants are *younger* than non-participants

Pre-Post (Before vs After)

Counterfactual: Participants' average levels of fitness, spending, and productivity before the program

Assumptions: Participants' fitness, spending, and productivity would not have changed over time in the absence of the program

What might threaten this assumption: Any factor that influences these outcomes overtime

Medical spending (parallel pre-program trends)

Note: Figure is illustrative and not based on actual study data

Medical spending (parallel pre-program trends)

Note: Figure is illustrative and not based on actual study data

J-PAL | WHY RANDOMIZE

Note: Figure is illustrative and not based on actual study data

Note: Figure is illustrative and not based on actual study data

J-PAL | WHY RANDOMIZE

What's the counterfactual? Pre / post change over time in medical spending among *non-participants*

Assumptions: Absent the program, participants and non-participants would have the same trajectory over time with respect to medical spending ("**parallel trends**" assumption)

Note: Figure is for instructional purposes only and not based on actual study data

J-PAL | WHY RANDOMIZE

Which of these scenarios would lead to nonparallel trends? (select all that apply)

- A: Healthcare costs tend to increase overtime
- B: Participants are older than non-participants
- C: An effective but expensive drug for a common chronic condition among older adults enters the market in 2014
- D: Options B and C at once

Note: Figure is for instructional purposes only and is not based on actual study data

J-PAL | WHY RANDOMIZE

Note: Figure is illustrative and not based on actual study data

What's the counterfactual? Pre / post change over time in medical spending among *non-participants*

Assumptions: Absent the program, participants and non-participants would have the same trajectory over time with respect to medical spending ("**parallel trends**" assumption)

What might threaten this assumption: Any change over time that disproportionately impacts either group

Difference-in-differences - results

Avg. Monthly Spending

Difference-in-differences - results

Difference-in-differences - results

J-PAL | WHY RANDOMIZE

Recap of results so far

Method	Gym visits / month	Medical Spending	Productivity
(1) Pre-Post	3.5**	-\$137**	0.01
(2) Simple Difference	-0.4	\$100**	15**
(3) Difference- in-Differences	1.34**	-\$9.6	0.01

Motivation: Before the intervention, participants were different from non-participants in various ways

Table 1 - Pre-intervention characteristics by participation status, before matching					
	Non- participants	Participants	Difference	Ν	
Avg. monthly spending (pre-intervention)	\$527	\$423	\$103**	2188	
Gym visits per month (pre-intervention)	5.6	7.7	-2.2**	3300	
Productivity index (pre-intervention)	0.55	0.54	0.01*	3251	
Male	46%	40%	6%**	3300	
Age	44.1	43.6	0.4	3300	
Caucasian	84%	84%	0%	3300	
Above median salary	48%	51%	3%*	3300	
Faculty	23%	18%	5%*	3300	

Notes: ***, **, and * indicate significance at the p-value < .01, .05, and .10 levels. Sample sizes vary across outcomes due to missing data.

Population with varying characteristics

After matching, participants look more similar to non-participants, but sample size is smaller

Table 2 - Pre-intervention characteristics by participation status, after matching					
	Non- participants	Participants	Difference	Ν	
Avg. monthly spending (pre-intervention)	\$203	\$184	\$19	1109	
Gym visits per month (pre-intervention)	0.47	0.33	0.14	1109	
Productivity index (pre-intervention)	0.54	0.54	0.0	1109	
Male	0.45	0.39	6%**	1109	
Age	43.1	42.7	0.4	1109	
Caucasian	91%	93%	2%	1109	
Above median salary	48%	48%	0%	1109	
Faculty	11%	8%	3%	1109	

Notes: ***, **, and * indicate significance at the p-value < .01, .05, and .10 levels. Sample sizes vary across outcomes due to missing data.

Counterfactual: Gym visits, levels of spending, and productivity among nonparticipants for whom there was a comparable participant match

Counterfactual: Gym visits, levels of spending, and productivity among nonparticipants for whom there was a comparable participant match

Key assumption: Participants' would have had the same levels of these outcomes as their non-participant matches if they had not received the program

Which of these scenarios would make participant vs. non-participant comparisons within the matched sample misleading? (select all that apply)

- A: Healthcare costs tend to increase overtime
- B: Participants are older than non-participants
- C: Participants are more *intrinsically motivated* to improve their health than non-participants

Counterfactual: Gym visits, levels of spending, and productivity among nonparticipants for whom there was a comparable participant match

Key assumption: Participants' would have had the same levels of these outcomes as their non-participants matches if they had not received the program

What might threaten this assumption: Any systematic difference between participants and non-participants that we can't measure (or forget to measure), that also influences outcomes

2016: Invitation to participate in study and baseline survey (N=12,459 employees)

2016: Invitation to participate in study and baseline survey (N=12,459 employees)

Key advantage: Because members of the groups (treatment and comparison) do not differ systematically at the outset of the evaluation,

any difference that subsequently arises between them can be attributed to the program rather than to other factors.

Treatment

Comparison

2016: Invitation to participate in study and baseline survey (N=12,459 employees) Study sample (N=4,834 respondents) Random assignment Access to Workplace Comparison Group Wellness (N = 1,534)(N=3,300)Х

Comparison of results across methods

Method	Gym visits / month	Medical Spending	Productivity
(1) Pre-post	3.5**	-\$137**	0.01
(2) Simple difference	-0.4	\$100**	15**
(3) Difference- in-differences	1.34**	-\$9.6	0.01
(4) Matching	0.61	-\$146	0.00
(5) Randomized evaluation	0.06	\$10	0.00

Note: *, **, and *** indicate statistical significance at the p-value < .10, .05 and .01.

Session Overview

- I. Background
- II. Why randomize case study
 - I. Non-experimental methods
 - II. Randomized evaluations
- III. Conclusions

IV – CONCLUSIONS

Conclusions – Why Randomize?

- There are many ways to estimate a program's impact
- This lecture highlights the advantages one: randomized evaluations
 - Conceptual argument: If properly designed and conducted, randomized evaluations are the most credible method to estimate the impact of a program
 - Empirical argument: Different methods can generate different impact estimates
- When randomized evaluations are impractical, non-experimental methods may be the best option. But being clear about the counterfactual and its underlying assumptions is key.

Thank you!
